PLANTING INSTRUCTIONS:

1. Place soil pellet in bottom of peat pot, and add water. Allow pellet to slowly expand, then fluff soil.

2. Add 3-5 seeds to soil, and gently push down into soil until seed is just barely covered. Do not plant too deeply!

3. Place pot in a warm spot with plenty of light.

4. Make sure soil never dries out, or gets too soggy. Soil should be consistently damp at all times.

5. Seedlings should emerge in approx. 5-20 days, depending on seed variety and temperature.

6. Once grown a few inches, thin to strongest seedling. You can then transplant (pot and all) outdoors, or into a larger pot.
