MINI BASIN TRIO

GROWING INSTRUCTIONS

**Cactus**

Dissolve growing medium pellet in 3/4 cup of water, fluff with fork, and place into basin. Sow cactus seeds by gently pressing them into the surface of the growing medium and lightly cover with a thin layer of growing medium. Cover basin with plastic wrap or enclose in resealable plastic bag. Place in a warm, bright location and keep growing medium moist but not overwatered; use a spray bottle to mist as necessary. Remove plastic once seeds germinate (1-3 months). Water by misting when the top 1/2" of soil becomes dry. Once seedlings develop tiny spines, begin watering with balanced plant fertilizer mixed at half-strength (feed only a few times per growing season). Cacti grow very slowly and will not need transplanting for 3-5 years. For more information, please visit us at www.buzzyseeds.com.

**Tip:** Cacti germination is enhanced when temperatures are kept warm, between 70° and 80°F.

**Aloe**

Dissolve growing medium pellet in 3/4 cup of water, fluff with fork, and place into basin. Sow aloe seeds by gently pressing them into the surface of the growing medium and lightly cover with a thin layer of growing medium. Cover basin with plastic wrap or enclose in resealable plastic bag. Place in a warm, bright location and keep growing medium moist but not overwatered; use a spray bottle to mist as necessary. Remove plastic once seeds germinate (2-4 weeks). Water by misting when the top 1/2" of soil becomes dry. Once seedlings develop a pair of leaves, begin watering with plant fertilizer mixed at half-strength. For more information, please visit us at www.buzzyseeds.com.

**Tip:** Aloe germination is enhanced when temperatures are kept warm, between 70° and 80°F.

**Moss Rose**

Dissolve growing medium pellet in 3/4 cup of water, fluff with fork, and place into basin. Sow seeds directly onto the surface of the growing medium, gently press in, and do not cover - moss rose seeds need light to germinate. Place in a warm, bright location with ample air circulation; keep growing medium moist but not overwatered. Moss rose seeds will germinate in 10-14 days. Once seedlings develop their second set of leaves, begin watering with plant fertilizer mixed at half-strength. For more information, please visit us at www.buzzyseeds.com.

Optional: If desired, put pebbles (not included) in bottom of pot for drainage.
